PHYS-4601 Homework 9 Due 14 Nov 2013

This homework is due in the dropbox outside 2L26 by 11:59PM on the due date. If you wish to turn it in ahead of time, you may email a PDF or give a hardcopy to Dr. Frey.

1. Raising and Lowering

(a) More or less Griffiths 4.18 Using the relation for $L_{\pm}L_{\mp}$ given in class and the text, show that

$$
L_{\pm}|\ell,m\rangle = \hbar\sqrt{(\ell \mp m)(\ell \pm m + 1)}|\ell,m \pm 1\rangle.
$$
 (1)

(b) In a vector/matrix representation of the $\ell = 1$ states where

$$
|1,1\rangle = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, |1,0\rangle = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, |1,-1\rangle = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, \qquad (2)
$$

use (1) to find matrix representations of L_{\pm} and then L_x and L_y .

(c) Griffiths 4.22(b) Use $L_+ \cdot Y_\ell^\ell = 0$ and $L_z \cdot Y_\ell^\ell = \ell \hbar Y_\ell^\ell$ to determine $Y_\ell^\ell(\theta, \phi)$ up to overall normalization.

2. Probabilities and Expectations based on problems by Ohanian

Some particle has a wavefunction

$$
\psi(\vec{x}) = \frac{1}{4} \sqrt{\frac{5}{\pi}} \sin^2 \theta \left[1 + \sqrt{14} \cos \theta \right] \cos(2\phi) R(r) , \qquad (3)
$$

where R is normalized $(\int_0^\infty dr r^2 |R|^2 = 1)$.

- (a) If you measure the total orbital angular momentum \vec{L}^2 , what are the possible values you would find and the probabilities you would measure each value?
- (b) Find $\langle L_x \rangle$, $\langle L_y \rangle$, and $\langle L_z \rangle$ in this state.
- (c) Find the uncertainty of L_z .

3. Landau Levels from Griffiths 4.60

This problem considers the motion of electrons which are essentially confined to a 2D surface in the presence of an orthogonal magnetic field. This is the system used to describe the quantum Hall effect. Since this is a 2D problem, we won't include p_z (if you like, you can imagine that we consider only eigenstates of p_z with zero eigenvalue).

- (a) Show that a magnetic field $\vec{B} = B_0 \hat{k}$ can be described by vector potential $\vec{A} = (B_0/2)(x\hat{j}$ y_i). $(i, j, k$ are unit vectors along x, y, z respectively.)
- (b) We saw on the last assignment that the Hamiltonian is

$$
H = \frac{1}{2m} \left(\vec{p} - q\vec{A} \right)^2 \tag{4}
$$

In this case, show that we can write

$$
H = \frac{1}{2m} \left(p_x^2 + p_y^2 \right) + \frac{1}{2} m \omega^2 \left(x^2 + y^2 \right) - \omega L_z \,, \tag{5}
$$

where $\omega = qB_0/2m$. Argue that $[H, L_z] = 0$ (you may use results from earlier problems).

- (c) Except for the L_z term at the end, this looks like a harmonic oscillator in the x and y directions. Write H and L_z in terms of the raising and lowering operators $a_x^{\dagger}, a_y^{\dagger}, a_x, a_y$ of those two harmonic oscillators. Evaluate $L_z|n_x, n_y\rangle$; is it diagonal?
- (d) Apparently we have not yet found how to diagonalize H and L_z simultaneously. Now define lower operators

$$
A = \frac{1}{\sqrt{2}}(a_y + ia_x), \quad \bar{A} = \frac{1}{\sqrt{2}}(a_y - ia_x)
$$
 (6)

and their adjoints, the raising operators. First, show that A, A^{\dagger} and $\bar{A}, \bar{A}^{\dagger}$ satisfy the usual commutation relations for raising and lowering operators. Then, find H and L_z in terms of $A, \bar{A}, A^{\dagger}, \bar{A}^{\dagger}$. From those expressions, argue that the energy eigenvalues are $E_n = \hbar \omega_B(n + 1/2)$, where $\omega_B = 2\omega = qB_0/m$ is the cyclotron frequency, and that the energy eigenstates are infinitely degenerate. These energy levels are called Landau levels; in practice, the finite size of the metal where the electrons live reduces the degeneracy to a finite amount.
