

## PHYS-3301 Homework 7 Due 29 Oct 2014

This homework is due in the dropbox outside 2L26 by 11:59PM on the due date. You may email a PDF (typed or black-and-white scanned) or give a hardcopy to Dr. Frey.

### 1. Some Short Practice Calculations

Calculate the following quantities. You should get a number for each answer.

- (a)  $\eta_{\mu\nu}\eta^{\mu\nu}$
- (b)  $\eta^{\mu\nu}\eta^{\lambda\rho}\epsilon_{\mu\nu\lambda\rho}$
- (c)  $\epsilon_{\mu\nu\lambda\rho}\epsilon^{\mu\nu\lambda\rho}$

Based on a problem by Sean Carroll In the next two calculations, define the tensor and vector

$$\left[ \begin{array}{c} X^{\mu\nu} \end{array} \right] = \left[ \begin{array}{cccc} 2 & 0 & 1 & -1 \\ -1 & 0 & 3 & 2 \\ -1 & 1 & 0 & 0 \\ -2 & 1 & 1 & -2 \end{array} \right], \quad V^\mu = (-1, 2, 0, -2) \quad (1)$$

in some inertial frame  $S$ . Then calculate the following:

- (d)  $X^\mu{}_\mu$
- (e)  $X^{\mu\nu}V_\mu V_\nu$

### 2. Derivatives Have Lowered Indices

As discussed in the class notes, 4-vectors with raised or lowered indices have the following Lorentz transformations:

$$a^{\mu'} = \Lambda^{\mu'}{}_\nu a^\nu \quad \text{and} \quad a_{\mu'} = \bar{\Lambda}_{\mu'}{}^\nu a_\nu, \quad (2)$$

where  $\Lambda$  is the usual Lorentz transformation matrix and  $\bar{\Lambda}^T = \Lambda^{-1}$  as a matrix.

- (a) Show that the matrix relationship between  $\bar{\Lambda}$  and  $\Lambda$  may be written as  $\bar{\Lambda}_{\mu'}{}^\rho \Lambda^{\nu'}{}_\rho = \delta_{\mu'}^{\nu'}$  and  $\bar{\Lambda}_{\rho'}{}^\mu \Lambda^{\rho'}{}_\nu = \delta_\nu^\mu$ , where  $\delta_{\mu'}^{\nu'}$  and  $\delta_\nu^\mu$  are Kronecker delta symbols.
- (b) Using the fact that the spacetime position  $x^\mu$  is a 4-vector, find the partial derivatives  $\partial x^\mu / \partial x^{\nu'}$  and  $\partial x^{\mu'} / \partial x^\nu$  in terms of  $\Lambda^{\mu'}{}_\nu$  and  $\bar{\Lambda}_{\mu'}{}^\nu$ . *Hint:* For two positions as measured in the same frame,  $\partial x^\mu / \partial x^\nu = \delta_\nu^\mu$  (think about why).
- (c) If  $f$  is a Lorentz invariant function (meaning its value at a fixed spacetime point is the same in any frame — like the temperature), use the chain rule to show that

$$\frac{\partial f}{\partial x^{\mu'}} = \bar{\Lambda}_{\mu'}{}^\nu \frac{\partial f}{\partial x^\nu}. \quad (3)$$

In other words, you are showing that a partial derivative has the same transformation as a 4-vector with a lowered index. As a result, people will usually write  $\partial_{\mu'} f \equiv \partial f / \partial x^{\mu'}$ .

### 3. The Relativistic Electromagnetic Field

We won't prove it, but the electric and magnetic fields can be written as a relativistic tensor with two indices  $F^{\mu\nu}$ . This tensor is *antisymmetric*, meaning  $F^{\nu\mu} = -F^{\mu\nu}$ . The independent components are (here,  $i = 1, 2, 3$  is a space index)

$$F^{0i} = E^i, \quad F^{12} = B^3, \quad F^{13} = -B^2, \quad F^{23} = B^1. \quad (4)$$

Since  $F^{\mu\nu}$  is antisymmetric, the diagonal components  $F^{00} = F^{11} = F^{22} = F^{33} = 0$ . (We have chosen a convenient system of units where the electric and magnetic field have the same dimension.)

(a) Consider two frames  $S$  and  $S'$  in standard configuration with each other. Show that

$$E^{3'} = \gamma \left( E^3 + \frac{v}{c} B^2 \right) \quad \text{and} \quad B^{3'} = \gamma \left( B^3 - \frac{v}{c} E^2 \right). \quad (5)$$

*Hint:* Remember that the Lorentz transformation of a tensor transforms each index independently:

$$F^{\mu'\nu'} = \Lambda^{\mu'}_{\alpha} \Lambda^{\nu'}_{\beta} F^{\alpha\beta}. \quad (6)$$

(b) Calculate  $F_{\mu\nu} F^{\mu\nu}$  and argue that  $\vec{E}^2 - \vec{B}^2$  is a Lorentz invariant quantity.

#### 4. Energy-Momentum Tensor

The energy-momentum tensor  $T^{\mu\nu}$  describes the energy and momentum densities of a fluid. The components are defined as  $T^{00} = \rho$ , the energy density;  $T^{0i} = T^{i0} = \mathcal{P}^i$ , the density of the  $i$ th component of momentum;  $T^{ij} = \sigma^{ij}$  for  $i \neq j$  describes the shear stress; and  $T^{ij}$  with  $i = j$  is the pressure  $P$  (we assume that the pressure is the same in all directions).

(a) Calculate  $\eta_{\mu\nu} T^{\mu\nu}$ .

(b) In the fluid's rest frame  $S$ ,  $\mathcal{P}^i = 0$  and  $\sigma^{ij} = 0$ . What is the momentum density in a frame  $S'$  moving at speed  $v$  in the  $+x$  direction with respect to  $S$  if the fluid is radiation with  $P = \rho/3$ ?
